

Express handlebars 3

Using helpers

//First remember to change middleware of handlebars and move it below helper

//First register helper before using middlewares

```
var hbs = exphbs.create({
  defaultLayout: 'main',
  helpers: {
    converter: function (date) {
      let datearr= date.toString().substring(4,15).split(' ');
      return `${datearr[1]} ${datearr[0]} ${datearr[2]} `;
    }
  },
});
```

//Now remove old middlewares if any and put this

```
app.engine('handlebars', hbs.engine);
app.set('view engine', 'handlebars');
```

//To use middlewares in view files use {{converter date}} where converter is helper function and date is argument passed to helper function
