Express5

res.locals

```
/*
res.locals is an object passed to whatever rendering engine your app is using (in this
case handlebars). They'll be 'global' in the render, so you don't need to prepend
anything on to them to use them.
It is mostly used to add global variables in project for various needs like users,auth
etc.
It is usually created in a middleware
*/
```

Create middleware for global variables

```
//Global variables
app.use((req,res,next) => {
res.locals.success_msg = req.flash('success_msg');
res.locals.error_msg = req.flash('error_msg');
res.locals.error = req.flash('error');
next();
});
```

To use it in handlebars

```
//Use it directly like
{{success_msg}}
```
