React Basics 7

Pure components

```
/*
Pure components rerenders only if state is really changed.Eg if we create a state like
state = {num:1} and in another function we set state state = {num:1} i.e same state,
normal component will still rerender. Pure component only rerenders only when state is
really changed. Note that Purecomponent performs shallow comparasion i.e if suppose
state is large and has nested objects and arrays then if we push or pop in suppose
nested array , pure component will not rerender as it will not notice it.
Use pure copmonent with care.
Purecomponent improves performance

//Import pure component
import React, { PureComponent } from 'react';

//Use pure component
class MoviesList extends PureComponent {
...
}
*/
```
