Mongoose 2

Create new data then save it in database then perform some function

```
new Idea({
title: req.body.title,
details: req.body.details
})
.save()
.then(idea => {
res.redirect('/ideas');
})
```

Best practice

```
Best way is to create a user object and then pass it in new idea like -
const newUser = {
title: req.body.title,
details: req.body.details
}
new Idea(newUser)
.save()
.then(idea => {
res.redirect('/ideas');
})
```

Eg- List all ideas on particular route, sort by date

```
//Idea Index Page
app.get('/ideas',(req,res) => {
Idea.find({})
.sort({date:'desc'})
.then((ideas) => {
res.render('ideas/index',{
ideas:ideas
});
});
});
```
