Express1

First require express

```
const express = require('express');
```

Then create app

```
var app = express();
```

Creating routes

```
app.get('/', (req,res) => {
// res.send('<h1>Hello Express!</h1>');
//we can send object directly and express converts it into json and
//content type as json
res.send({
name: 'Akash',
likes: [
'swimming',
'chess'
]
})
});

//here app.get takes 2 parameters first is url and next is function
//which takes two parameters request(req) and responsee(res)
//req stores info about request comming in like header use, body info,
// any method that was used with request etc
//res specifies what to send back like data type(html or json), status code
```

Listen to port

```
app.listen(3000);
```

Express.static

```
//app.use is a middleware
//express.static takes absolute path so use __dirname
app.use(express.static(__dirname + '/eg'));
//Note that here we are not using app.get and we are also not using res.send
//to send data but we are trying to access html file stored in a folder
//Access page using url - http://localhost:3000/help.html
//All assets are stored in eg folder using express.static we can directly access them
```
